

# How do I start a cattle feed industry?

## Detail Introduction :

With the gradual improvement of living standards, the consumption of beef is increasing, the profit of beef is also considerable, the economic benefits brought by cattle breeding are getting higher and higher, and the number of natural farmers is also increasing.

## How do I start a cattle feed industry?

Many farmers don't know where to start. Next, we will talk about what needs to be prepared to raise cattle, I hope it will help you.

### A. Preparation before raising cattle

#### 1, knowledge base

Be diligent, go to more bookstores, buy more books about raising cattle, and compare them with each other to have reference value. Don't just browse it and think you understand unless you are a learning genius. Study hard, and it's okay to raise cattle a few days later. It's the most terrible if you don't know how to prepare and don't understand.

#### 2 Learn to match the diet

At least we must know the relationship between daily gain and diet, and know how many grams of diet is the most economical. If you think the manual preparation of the diet is troublesome, spend a thousand dollars to buy a feed formula software. After buying it, you will know that it is definitely not a waste of money.

#### 3, the way to choose the feeding

Choosing the feeding method determines the way you build the cowshed. If you choose to fence free-range, you will save a lot of steel pipe partitions. Now the books, some recommend tethered feeding, some recommend fencing free-range, each with its own benefits, the most intuitive benefit of fencing free-range is to save effort, less disease. If you don't make a decision, then you can raise them in a free-range under the supervision of catties. After 850 catties, you can raise them in a tether, which not only takes care of the cattle's physical development but also reduces energy consumption.

## B. Matters needing attention in the process of raising cattle

### 1 Buying cattle

The first thing to do is to buy cattle. Before buying cattle, you should know the formula for measuring weight. If you are embarrassed to take a leather ruler on the spot to measure, then you have to practice eyesight first. Find a ruler, look at it every day, over time, you will be able to see accurately. If this is not practiced, the only way to buy cattle is to lose out. Don't be superstitious about weighing on the spot, especially don't tell the seller to buy by weight first. The seller should give the cow some water first. Just be afraid to fill the cow with water. If it gets into the lungs, the cow will be worse off.

### 2 Feeding quantity

If you feed less, go to the nearby cattle market to buy it, if you buy more, but I think it is better not to buy more first, first buy a ten head or eight head, accumulate experience, and then feed more, otherwise for you may be to lose money.

### 3, about self-propagation and self-rearing

When you have experience in raising cattle, it is best to breed yourself. The quality of buying shelf cattle directly determines whether there is a profit, because the cattle grow faster and slower, and the difference is not very large. Self-reproduction and self-support can bring greater profit margins.

### 4 Drink water

Many people say that they drink water several times a day. In fact, why is it so complicated? Set up a water tank so that the cow can drink whenever he wants.

### 5 Feeding times

Add enough material at once, free feeding, not only to reduce the amount of labor but also to maximize the weight gain potential of cattle. Because you are feeding ten times a day, cattle feeding has not increased. In the summer separates two feedings to avoid acidity and spoilage.

## 6 Cattle disease

Beef cattle are raised for a short time, and if the medical costs invested are too large, there is no value in raising them. It is the time to test your determination, don't believe in miracle doctors, and give up when it's time to give up.

## 7. Feeding quantity

Even if you have a relatively cheap diet, you will soon find that cattle can't eat that much. Of course, cow rations rely on quantity to make up for the lack of energy per kilogram of feed, so don't be happy about low energy rations. The solution is to expand the volume of the cow's stomach first.

## 8 Feed

Feed must be prepared in advance, save the cloudy days and rainy ones, you can't buy it in time, you should buy Feed Production Line to make feed at any time.

## 9 Daily weight gain and diet

Don't believe in software and standards, cows and cows are different. You have to measure more weights and then adjust the diet according to the measurement results.

## 10 Don't feed lean meat extract

One is the crime of endangering health, and the other is the crime of producing and selling harmful feed. If you want to engage in the industry of raising cattle, this article will help you a lot, understand the cow's diet and I believe you also know how to raise cattle. As for the choice of cattle feed, it can be made by Feed Production Line. If there are other aspects of the question, pay more attention to us, you will find the answer.
